Topic: Variables and Data Types

In Java, primitive variables are stored on the stack.

- int: used for integers (e.g., `int age = 21;`)
- double: used for floating-point decimals (e.g., `double price = 19.99;`)
- boolean: used for truth values (e.g., `boolean active = true;`)

To declare a list, use: `List<String> list = new ArrayList<>();`

Topic: Conditional Statements

Control flow in Java is directed using `if`, `else if`, and `else` blocks.

Example:

```
if (score >= 90) {  
    System.out.println("Grade: A");  
} else {  
    System.out.println("Grade: B");  
}
```

Topic: Git Commands Cheatsheet

- `git init`: initializes a new local Git repository.
- `git add .`: stages all changed files in the working directory.
- `git commit -m "message"`: commits changes to history.
- `git push origin main`: sends local commits to GitHub repository.
